

Docket No. PHN 17,833 (PHIL06-17833)
U.S. Serial No. 09/741,919
Patent

IN THE SPECIFICATION

Please replace the title of the invention with the following:

*B1
cancel.*
Multiple Window Display System Using At Least Two Remote Controls

Please amend Page 6, Line 27, to Page 7, Line 2, as follows:

*B2
cancel.*
If the prefixed window identification signal constitutes a regular control command for selecting a window to be controlled, the television receiver can be a conventional split-screen television capable of selecting a window in response to said regular control command. The association means of the present invention are thus comprised in the remote controls 215 and ~~215~~216. The user command is issued automatically by the remote controls 215 and 216 comprising the window identification means 217 and 218 according to the invention. Additionally, the user command may still be issued manually, and the remote control may comprise user operable means for bypassing the window identification means to switch off the automatic window selection.
